

PREFACE

With reference to our TYBCA syllabus We have to arrange system software project with use of visual basic & oracle.

The main purpose of arranging such training is to get some practical knowledge and experience about various aspects of management.

We have taken system software of Patel medical. We have noted all the required information for our practical training and which were submitted to our concerned persons of the computer class.

1. PROJECT PROFILES

Definition

I prepare the project of Patel medical on Windows XP. Because I have knowledge of VB and Oracle it. medical is very different types of subject there are many types of product in over project and give a very smooth and very easy detail in over project and also relative physical detail in customer to our project.

Scope

It works on Windows 98 and appears version windows. It will be developed for Patel medical. It is user friendly all information is English like language. There for any user can easily use this project.

Objective

System : Windows XP

Front-end : Visual Basic

Back-end : Oracle

2. SYSTEM REQUIREMENT & SPECIFICATION

SYSTEM ANALYSIS

Now a days we do all work with computerized system but with current system is very complicated to keep the track of all registers and handle them manually. As well as this work is time consuming & also expensive in this system report work may be not accurate and not fastest.

Drawbacks of current system

1. Time consuming...
2. More expensive...
3. Searching problem...
4. Maintains problem of all registers...
5. Less accuracy...
6. Problem for marking of not normal value...
7. More stationary...
8. Display multiple reports...

Advantages of computerized system

1. Time saving...
2. Less expensive...
3. Powerful searching...
4. Solve the problem of maintains register...
5. More accuracy...
6. Easy generate report...
7. Not display multiple reports...

FEASIBILITY STUDY

There are 3 major Areas that determine the feasibility of the project . These all areas combine defines whether the project is feasible or not .

These major areas are given below:

1) Technical Feasibility :

It is considered in terms of technical requirements and their availability in the markets. It determines whether the current level of technology supports the proposed system or not . The technical possibility of proposed system or not. The technical possibility of proposed system is as follows:

- ◆ The units does process the hardware as well as related software for the projects.
- ◆ The proposed system does not require much technical details.
- ◆ The current manual working is not so much sufficient.
- ◆ It just requires window operating system.
- ◆ The organization has already purchase all the enough devises for latest technology.

Hence, the proposed system is technically feasible.

2) Economically Feasibility:

The economical feasibility is considered in terms of money/price value .The organization measure the cost effectiveness of the project . The economical feasibility of the proposed system is as under:

- ◆ The organization is ready to invest in proposed system for latest technology and best result.
- ◆ As the personnel and the manager know the computer operating, the unit need not have to appoint any computer operater.
- ◆ The units has not be spend much amount for the computer hardware and software.

The organization is in position and also incapable to pay for the system.

3) Operational Feasibility:

As the ultimate feasibility, consideration of the proposed system will fulfill the department's requirements. It decides whether the proposed system covers all the operational feasibility is as under :

- ◆ The proposed system will fulfill the organization's requirements.
- ◆ The proposed system covers all the aspects of current manual system .
- ◆ The responsible users of the system i.e. manager , accountant and partner are honestly enthusiastic for the new system.
- ◆ The changes of this system being operational are quite strong.

PROPOSED SYSTEM:

In proposed system, the management needs not to keep any type of registers, which they use to keep in old one. They have work only with one computer. All the details are stored in computer files. The dual entries are done very quickly as entry in one file only , affects the other file where it has to record. In the way there is no need to record the computer operator.

The working through registers system is not only very laborious and time consuming , but there are number of errors found. In comparison to old system the proposed system of computer processes many advantages.

Some of the merits of proposed system are as follows:-

- **Accuracy:-**

It is one of the features of computer that it provides accuracy result. It is often said, "Man does mistakes but machines never".

When a man works there seems numbers of errors and mistakes in performing calculation and other things, while it is not in case with computers.

- **Security:-**

The security is maintained vary comfortably in computers. Secretes are not disclosed off, as there are password settings in the computers. So the firm can get the benefit of non-disclosure of its secrets to the outsider competitors as well as other non-authorized persons.

- **Time saving:-**

The computerized system is time saving. On an immediate inquiry, the operator or any authorized person has to just click some switches and get the information in few seconds.

- **Perform Repetitive Task Very Well:-**

It is said that computer never tires. I do the repetitive task very well as it never feels laziness. Performance of repetitive task by a man is not well

Performed, as man tires very quickly and feels lazy. It is not in the case with computer. So, proposed system is beneficial than Old one.

- **Low cost:-**

The computer need not change year as it happens in case of registers. In register system clerk, employees and also managers are needed to fulfill the management activity while in computer system the two persons are enough for all the work. So in proposed system the two persons are enough for all the work. so in proposed system the two persons and expenses of registers are saved annually.

- **Easy Maintenance:-**

The maintenance of the computer is not tough job as compared to the registers, as it may not be lost or damaged. So there is only soft or easy maintenance needed with computers.

- **Easy Modification:-**

In case of any change in data stored, the modification or editing can be done very easily and clearly through computers, but this is not possible with registers.

- **Attractive and Status:-**

Computer creates different kind of impression in mind of computer or any other person. computer tends to increase in reputation/status of the firm. whenever party required any information the units has just to print to out clicking some switches. so with the help of computers, promoters can increase their profit.

Hence, with these merits, it would be very unwise and reckless to manage the organization through the system of book keeping. as it is said that prevention is better than cure, it would be very fine and intelligent decision to have computer application system in management.

SYSTEM REQUIREMENT

Hardware Requirement

- ◆ Pentium processor
- ◆ 256 GB RAM
- ◆ 80 GB Hard Disk
- ◆ Keyboard & mouse

Software Requirement

- ◆ Operating System: Windows XP
- ◆ Front end tool: Visual Basic 6.0
- ◆ Back end tool: Oracle 8i
- ◆ Others: Unbound connectivity with Oracle database by ADODB Control of visual basic

USER REQUIREMENT

Features of VB

Features of VB Visual basic syntax ideally suited for producing windows application. Msword, MsAccess and MsPowerPoint all share visual basic for application the exact same language syntax in visual basic in 6.0.

Visual basic continues the tradition Of simple, powerful and easy to learn language yet adds enough extended capabilities to the satisfy o most jaded developer.

Several significant facts contribute to visual basic is bright future. First visual basic hedge product millions of developers of all skills levels are producing application with visual basic secondly VB powerful development system. It contain built in function to its intrinsic features VB provides the capability to produce custom libraries and objects that can be loaded at run time or bound to the distributable application. Thirdly VB also well supported by their party product. Microsoft is indisputably the largest and the most successfully software company in the world.

For all these and many more visual basic is indisputably the most attractive development environment urgently available. In the contrast to the absolute systems of the past, visual basic has an under sizably bright and shining future.

About Oracle 8i Introduction

In 1977 Larry Elision, Bob Miner & Ed Oates formatted a company built RDBMS using C & the SQL interface. Soon, after they come out with version 1, a prototype. In 1979 RSI delivered its first product to customers. The Oracle RDBMS version 2 worked on the digital PDP-2 operating system & was soon ported to the DEC VAX system. 1983 heralded the release of version 3, which touted changes in the SQL languages as well as performance enhancement & other improvements. Unlike earlier version 3 was written almost entirely in c. At this point RSI change its name to ORACLE CORPORATION.

Oracle version 4 was released in 1984. This version supported both the VAX system and the IBM operating system. Version 4 was the first version to incorporate read consistency. Version 5 introduced in 1985, was milestone it introduced client/server computing to the market with the use of SQL*NET. Version 5 was also the first MS-DOS product to break through the 640 KB barrier.

In 1988 Oracle presented version 6 which introduced low level locking as well as a verity of performance improvements & functionality enhancement including sequence generation & differed writes. I was introduced to Oracle 6 back in the days when we ran the TPI, TCP-A & TCP-B benchmark. At this point oracle was running on a large verity of different platforms & operating systems. In 1991 Oracle introduced the oracle parallel server option was available on a variety of platforms.

Oracle 7 released in 1992 including many architecture changes in the area of memory, CPU & I/O utilization. Oracle 7 is a full-featured RDBMS to which you are accustomed the one you have been using for many years.

3. PURPOSE OF PROJECT

APPLICATION

The Proposed Patel medical management is the completely computerized.

In proposed system there is no need to maintain data about medicine because all process of that data done in computerized.

The modern age the age of computer is an electronic device, which fetched record very quickly. The computers are very quickly accepted in trade line as it as many advantages such as speed, accuracy, security etc.

In this proposed system all the add, edit, delete, search in project of computer are done through computerized system.

REQUIREMENTS

In purpose of project, the management needs not to keep any type of registers, which they use to keep in on one. They have work with only one computer. The dual entries are done very quickly as entry is one file only.

The generation is very fast. Every one wants to work quick and rapidity

So, this not possible with the manual system so, we use this system with computer and get the answer quick and fast as soon as possible

4. SYSTEM DESIGN

DATA DESIGN

One of the tools of structured analysis is the diagram. A data flow diagram is a graphical representation of the system. The analyst can use dataflow diagram to explain this understanding about the system.

APPLICATION:-

- Data flows are an intuitive way of showing how data is processed by a system.
- At analysis level analyst should be used to model the way in which data is processed in the existing system.
- Data flow models are used to show how data flows through a sequence of processing steps.

DESCRIPTION:-

- A graphical tool used to describe and analyze the movement of data through a system manual or automated including the process store of data and delays in the system.
- The transformation of data from input to output through processes may be described logically and independently of the physical component associated with system.

- The data transformation at each step before moving on to the next stage. These processing steps or transformation are programs function when data flow diagrams are used to documents a software design.

The symbols that are used in the data flow diagram carry following meaning.

Rectangle

it symbolizes the sources.

Ellipse/Circle

it symbolizes the process.

Open Rectangle

it symbolizes store data.

Unmarked Line

it symbolizes connectivity

Without a dataflow.

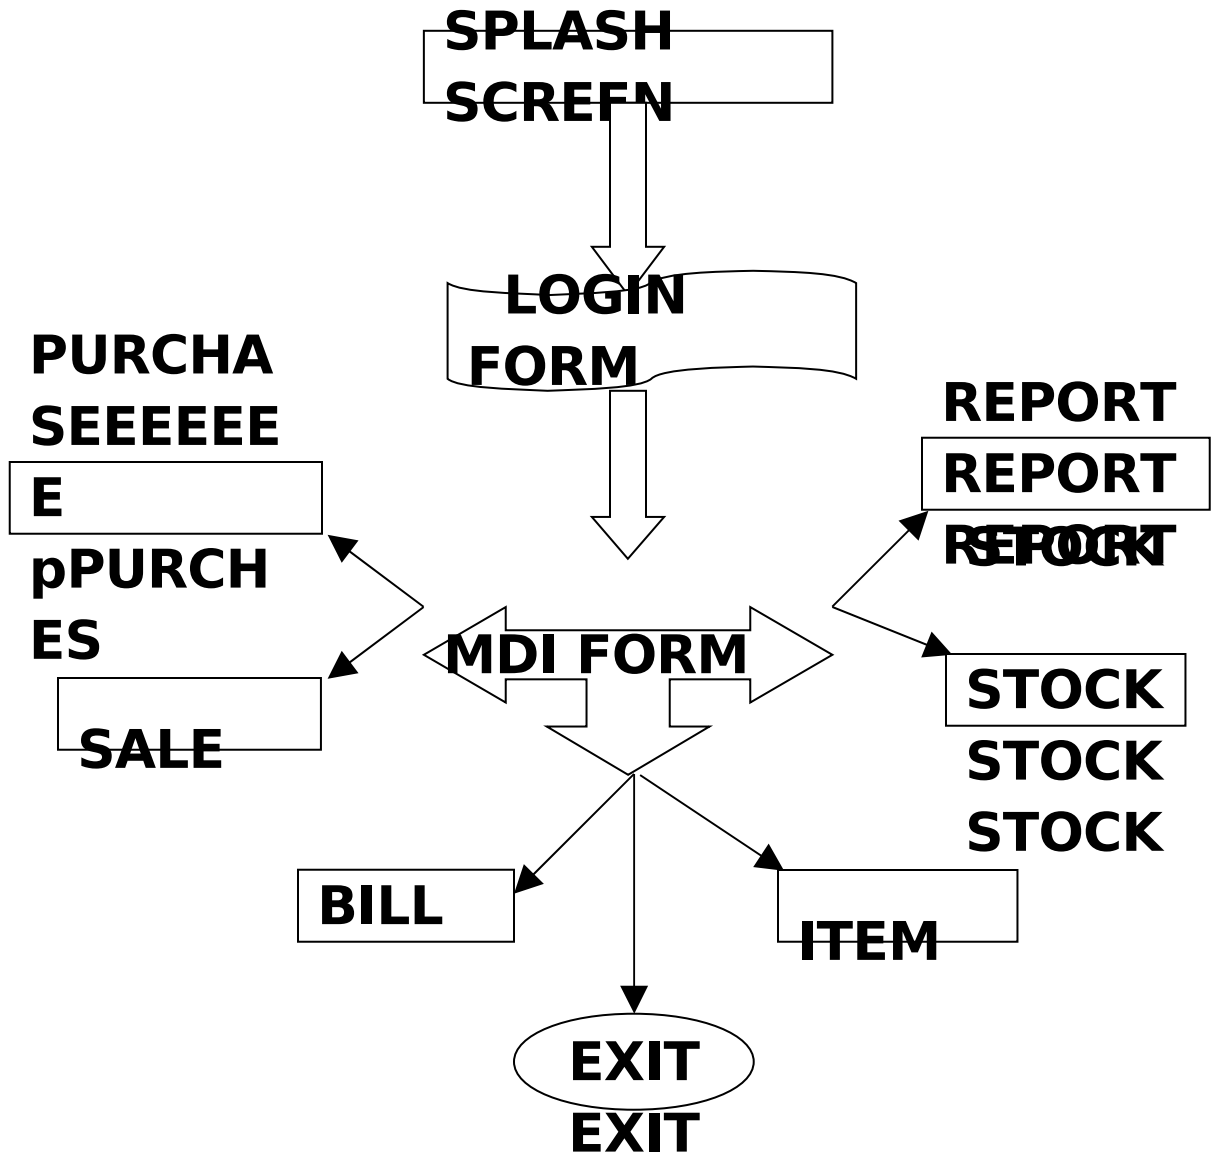

Marked Lineit symbolizes connectivity

With a dataflow.

Report

Purchase item

The screenshot shows a web browser window titled "DataReport1" with a zoom level of 100%. The main content area displays a report titled "Purchase Item" in blue text. Below the title, a list of fields and their corresponding values is shown in red text. The fields include RECORDNO, AGENCYNM, ITEMTYPE, ITEMNM, ENTRYDT, MFGDT, EXPDT, PPR, QTY, and TOTAL. The values are: 1, ravi trades, Botal, tulshi, 05-Sep-11, 12/2/2011, 2/2/2015, 50, 2, and 100 respectively. The browser's status bar at the bottom indicates "Pages: 1".

RECORDNO:	1
AGENCYNM:	ravi trades
ITEMTYPE:	Botal
ITEMNM:	tulshi
ENTRYDT:	05-Sep-11
MFGDT:	12/2/2011
EXPDT:	2/2/2015
PPR:	50
QTY:	2
TOTAL:	100

7.TESTING

TESTING PRINCIPALS

Software testability is simply how easily computers programs can be tested. The checklist that follows provides a set of characteristics that lead to testable software.

- Portability.
- Observable.
- Controllability.
- Decomposability.
- Simplicity.
- Stability.
- Understandability.

TESTING METHOD

The phase of system development life cycle tests system design. Testing of system decides whether the newly designed system works properly or not.After the development of documentation manually about the system this stage is checked. And if the system working properly then it will be considered for implementation and if isn't then system analyst is informed to find out generated errors or problems and to find out its solutions. This process is known as debugging.

For any software system testing means to check out it's coding.If there is not any problem in the coding then that code is proper and efficient to design.If we are not getting proper or required output then we have to debug the system coding.So,the debugging is also a subpart of the testing section.If the system runs correctly during testing then is no need to debug.

During the testing of our project we have to face different types of errors. Especially,database errors annoyed us but at last we solved it,successfully.Some of the errors are listed below with their cause and solution.

VARIOUS TESTING METHOD

There are many methods for testing as system testing can be one of the following types,

➤ **Unit Testing:-**

Unit testing means to test individual unit of the system. Each unit is tested thoroughly for its errors and outputs. All the units of system are tested and if found of then assemble into one system and then system testing is done.

Unit Testing Plan Is Sub Divided Into Following Parts:-

- Functional Test
- Code Test
- Navigation Test
- Cosmetic Test

Various Level Testing:-

- Field Level Testing
- Query Level Testing
- Program Level Testing

➤ **Black Box Testing:-**

This is concerned with the proper execution of the program specification. In this testing, each function or sub program used in the main is first identified. It is complementary to White Box Testing. It uncovers a different class of errors which are not discovered by White box Methods

➤ **White Box Testing:-**

This is concerned with implementation of the program. In this, different programming structures and data structures used in program are tested for missing function, performance errors, Errors in external database access, Initializing and terminating errors.

➤ **Interface Testing:-**

This is concerned with the both program specification and program implementation. This type of testing is particularly important for object oriented system.

➤ **Alpha Testing:-**

Test performed at the developer's site Before the system is finally installed in the working environment is known as alpha Testing. It is also known as Acceptance test since it is performed before the system is accepted as being fit for intended users.

➤ **Beta Testing:-**

In this testing, the system is delivered to a number of potential users who agree to use that system and provide feedback to the designers. Testing should be repeated if any modification is done based on the feedback given by the users. Hence, it is sometimes called as regression testing.
